

I parsed the text into groups of 5 and then used the morse code characters for "atru", but anagrammed them first as "eatru" or ". .- - .- .-." and the dashes represent which letter is replaced. The method for changing the letters is to count forward with the pattern "4 11 4 4" (which are the counts of relevant boxes in the Berlin Clock), but again they are not always in the same order. I first used "11 4 4 4" on the cipher text "UAUHU" and the pattern of ".-.-" (Indicating the second "U" and the "H" change) which resulted in "UAZIU". Using the bifid cipher encryption method to decrypt this text (yes, it's done backwards) and the Polybius square:

```
12345
1 NUVWX
2 CDEFZ
3 BLMGK
4 AJIHR (R/Q)
5 SOTPY
```

I get "XFIND". So the first 10 characters decrypt to "ATRUEXFIND"! and it truly was. I was bolstered and felt confident this was a path worth pursuing. Here is the process of how I decrypted the first phase of K4:

KGIDC + -...- + 4 4 = CGIDC => EULJR => JRULE

This doesn't seem like a sentence, but it does anagram to a single letter and a 4 letter word like the previous 2 sections.

The "endYAhR" with the superscript letters in Kryptos have this pattern: "...-.-" which I thought were a reversed Fibonacci set, but given what I have found, I believe it is ". .- - .-" or ". .- - .-." which is euta, or eutr in morse code. If I were to extend this theory, the last letter ("r" in the first instance and "a" in the second) does not have a raised letter, which may indicate the removal of a letter in addition to changing it in the "11 4 4 4" fashion. If this were the case and with trial and error I get:

KGIDC + -...- + X 4 4 = CGIDK => EULIR => IRULE

I have tried to further this idea, but I didn't get where I wanted to go so I stopped. I'm not saying this is wrong, I'm saying I didn't pursue this fully. Here is a full list of what I did try and the results all anagram out to a single letter followed by a 4 letter word with none of the letters in the 5 character section repeating.

RACKE => ATRUE

eatru => .-.-.-.-

UAUHU + .-.-. + 11 4 = UAZIU => XFIND

KGIDC + -.-.- + 4 4 = CGIDZ => EULJR => JRULE

taure => -.-.-.-.

JTXZK + -.-. + 11 4 = ZTGZK => FOYKE => FYOKE

DGWKP + -.-. + 4 4 = PGNKP => SIKRW => WRISK

rateu => .-.-.-.-

FZMTT + .-.-. + 4 11 = FZPTI => FREPT => PFRET

VPYNB + -.-.- + 4 4 = VPNNW => NBSAW => BSWAN

teuar => -.-.-.-.

FNIWA + -.-. + 4 11 = ANIWZ => INWUR => WRUIN

IDULK + .-.-. + 4 4 = IJUSK => JKAEX => XJAKE

rteau => .-.-.-.-

JTAWZ + .-.-. + 4 11 = JZATZ => AZEOR => AZERO

ZKESS + .-.-. + 4 4 = ZQESQ => EYARZ => ZYEAR

eutra => ...-.-.-

QJSQT + ...- + 4 4 = QJSOS => AYJZS => ZJAYS

WTOSS + .-.-. + 4 11 = WKOSF => URCOP => CPOUR

terau => -.-.-.-

KGNRP + -.-. + 4 4 = PGNVP => SAMRW => WRAMS

QQVRL + .-.-. + 11 4 = QOVRB => IPYEN => YPINE

uaret => .-.-.-.-

FWBBF + .-.-. + 4 4 = FWLBS => DINRB => BRIND

ILOSB + .-.-. + 11 4 = IUUSG => JKNEW

truea => -.-.-.-

LUHGO + -.-. + 11 4 = OUWGO => PEWRU => WPERU

XOURK + .-.-. + 4 4 = XBURW => UPKNW => WPUNK

I'm not saying this is how to decrypt Kryptos, I'm saying I have found a pattern of decryption that seems plausible (except for the fact that there's no way to rearrange the resultant word list to create "BERLINCLOCK", but that's minor, right? :)).

I'm sorry if this is confusing, it was hard to keep all this information in my head and I got some things wrong because of the complexity and my sporadic and constrained time spent on the effort. After finding "XTRUE" it took me 2 weeks off and on to finish this. If I were dedicated to this it would have taken me less time.
