

		ascii		letter code
A	65	01000001	0	00000000
B	66	01000010	1	00000001
C	67	01000011	2	00000010
D	68	01000100	3	00000011
E	69	01000101	4	00000100
F	70	01000110	5	00000101
G	71	01000111	6	00000110
H	72	01001000	7	00000111
I	73	01001001	8	00001000
J	74	01001010	9	00001001
K	75	01001011	10	00001010
L	76	01001100	11	00001011
M	77	01001101	12	00001100
N	78	01001110	13	00001101
O	79	01001111	14	00001110
P	80	01010000	15	00001111
Q	81	01010001	16	00010000
R	82	01010010	17	00010001
S	83	01010011	18	00010010
T	84	01010100	19	00010011
U	85	01010101	20	00010100
V	86	01010110	21	00010101
W	87	01010111	22	00010110
X	88	01011000	23	00010111
Y	89	01011001	24	00011000
Z	90	01011010	25	00011001

Using ascii codes (A=65)

	e	n	d	y	a	h	r	o		
L	0	1	0	0	1	1	0	0		
Q	0	1	0	1	0	0	0	1		
	e	n	d	y	a	h	r	o		
O	0	1	0	0	1	1	1	1		
U	0	1	0	1	0	1	0	1		

Using letter index (A=0)

	e	n	d	y	a	h	r	o		
L	0	0	0	0	1	0	1	1		
Q	0	0	0	1	0	0	0	0		
	e	n	d	y	a	h	r	o		
O	0	0	0	0	1	1	1	0		
U	0	0	0	1	0	1	0	0		

Hypothesis:

That flipping bits of characters' ASCII codes might be a "masking technique" for one step of K4 decryption. It would require that the mistakes in IQLUSION (L->Q) and UNDERGRUUND (O->U) are suggestive of the bit-flip technique, and the raised letters in dYAhR (01101 where 1 is raised) indicate which bits to flip.

Result:

The ASCII code bits to go from O->U follow this pattern.
The ASCII code bits to go from L->Q do not.

Conclusion:

Perhaps this is a valid theory which should be investigated more, but the IQLUSION "mistake" is unrelated?
