

twas blinky and the garbled text
 did flicker briefly on the screen
 all used up was the sectored disk
 and sysop eyes were narrow green

the sysop lubered as he smote
 what message this that will not die
 the system froze in core dump heap
 the warning burned in terminal eye

Starting with the last letter of the enciphered text I pulled it off nine letters at a time and built the box at the left. I ended up with 109 letters and so dropped the first letter of the message. Each column was pulled off using the key word as a guide. Note the blue characters in the table.

Above is the nine line poly table pulled from the middle of the tableau on the sculpture. To the left is a copy of the table from the preceding page.

Below is four lines of 27 characters. My final step was to wrap the lines instead of running left to right on each line. So they read, left to right, right to left, left to right and finally right to left. All columns are read top to bottom but a nasty twist would be to wrap the columns, top to bottom, bottom to top when setting up the message to send it.

The purpose of the exercise is to build something that looks like K4 and understand the process that built it. I will continue to pull as much meaningless data from it as I can. Why do letters double? Is that inherent to the poly tableau or is it caused by process or both? What letters from the tableau are used, which are skipped? Why?

There is a big wedge of a crib in my process that makes it very weak.

No need for sequential alphabets, use a random selection set by process.
