Playing with a transpose idea. 97 is a prime number as is 31, (the length of the last three rows), but that could be for aesthetic purposes. It is a piece of art. 96 however has a number of factors and only requires a null to give 97 characters. I chose an 8 by 12 table. Now how to build it. I suspect the finished cipher was taken off in columns. The Berlin Clock clue suggests the table be built from the bottom, last cipher letter in the bottom right hand corner. Now this a transposed table as I have no idea which column should be where to show the keyword but this is how I think they were taken off.

Some interesting things to notice here. Common letters, as an example Q, or B, maybe U, have 8 characters or multiples of 8 between them in the same column. This could be coincidence but suggests to me that the key has 8 letters. That means the Q in line 1 and the Q in line 2 are the same letter, same alphabet. The pair of Qs in line 2 are probably a common 2 letter sequence, like ed or st. Notice the first 4 letters, OBKR, start the first column. But look at row 7. I see OBK are the first 3 letters and the 4th letter is one letter further; OBKR OBKS. I don't know what that means.
