

K3 CRYPTOGRAPHY

k3'S SOLUTION IS WELL KNOWN WITH VARIOUS DECRYPTION MODELS PROPOSED; ALL OF WHICH INVOLVE ANAGRAMMING. JS EXPLICITLY STATED THAT IT WAS NOT THE METHOD EXPECTED, AND ES SAID THE ACTUAL K3 CRYPTOGRAPHY WOULD BE 'HELPFUL' IN THE ANALYSIS OF K4. THIS PAPER PRESENTS A STRONG CASE FOR K3'S CRYPTOGRAPHY, ENCRYPTION AND DECRYPTION. AND A STRONG CASE FOR A CAUSAL CRYPTOGRAPHIC CONNECTION BETWEEN K3 AND K4'S CRYPTOGRAPHY.

K3
ENCRYPTION:

PLAIN TEXT IS INSCRIBED INTO A 14 X 24 INTO THE LOCATIONS SPECIFIED BY THE KRYPTOS KEY IN BLOCKS OF 84 LETTERS. THE FOUR BLOCKS OF 84 USE THE FOLLOWING KEY IN THE ORDER GIVEN:

4 1 5 2 6 3 7
3 7 4 1 5 2 6
2 6 3 7 4 1 5
1 5 2 6 3 7 4.

THE FOLLOWING MATRIX DISPLAYS THE PROCESS: (FIRST 10 LTS PLACED)

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	S	1	1	1	L	1	key: 4 1 5 2 6 3 7
2	2	2																						2
2	2	2																			W			2
3	3	3																						3
3	3	3																		Y				3
4	4	4																						4
4	4	4																E						S
5	5	5																						5
5	5	5														P						O		5
6	6	6																						6
6	6	6																			L			6
7	7	7																						7
7	7	7																		D				7

THE PATTERN IS SIMPLE, COMPELLING, AND OBVIOUS IN BOTH THE VERTICAL, HORIZONTAL, AND DIAGONAL . THE REASON FOR THE DOUBLED ROWS FOLLOWS FROM THE PATTERN. ONE CAN ONLY INSCRIBE 42 LETTERS. IN THE 14 X 24 MATRIX AT A TIME. THEREFORE, FOR THE SECOND 42 EVERYTHING MOVES UP ONE ROW. AND USES THE SAME KRYPTOS KEY AS THE FIRST 42.

THE SECOND BLOCK OF 84 USES THE KEY 3741526. AND SO FOR THE REMAINING TEXT AND BLOCKS. SINCE ALL ALL SETS OF 42 BEGIN IN THE RIGHT MOST COLUMN (24),ALL STARTING POSITIONS MUST BE DIVISIBLE BY 24. THEREFORE, THE VAUNTED 192 IS SIMPLY THE STARTING POSITION OF THE MESSAGE.

IMPORTANT: NOTE THE POSITI ON AND STRUCTURE OF THE PLACEMENT OF THE 42 LET-
TERS SUBSETS. THEY FORM A 7 X 14 ROW GRILLE WITH 6 APERTURES PER ROW, EACH SPACED
4 CELLS APART. THESE APERTURES ARE KRYPTO KEY IDENTIFIED.

K3 DECRYPTION

WHEN PLACED OVER A COMPLETELY FILLED 24 X 24 CIPHER MATRIX, THE PLAIN IS READ OUT
OF THE APERTURES FROM TOP TO BOTTOM, RIGHT TO LEFT USING KRYPTOS KEY TO ALIGN THE
INITIAL SETTING OF EACH BLOCK OF 84. THE GRILLE IS THE DECRYPTION CRYPTOGRAPHY.

IF K3 CRYPTOGRAPHY WOULD BE A 'HELP' IN THE ANALYSIS OF K4, THEN ONE WOULD LOOK
FOR REFLECTIONS OF K3 CRYPTOGRAPHY IN K4. I HAVE AND THERE ARE.

K3 / K4 CRYPTOGRAPHIC CONNECTION

THE THREE DIRECTIONAL ONE OFFS* BETWEEN R1 AND R2 , THE SIX DIRECTIONAL ONE OFFS
BETWEEN R3 AND R4 , THE THREE REVERSED DIRECTIONAL ONE OFFS BETWEEN R4 AND R3,
AND THE WRAP AROUND OF R5 WITH R1 WITH A DIGRAPIC CIPHER HIT BOOKENDED BY TWO
DIRECTIONAL ONE OFFS ARE CAUSAL. THE CONTINUITY BETWEEN R1/R2 AND R3/4, THE DIS-
CONTINUTITY BETWEEN R2/3, AND THE R5/R1 WRAP-AROUND ARE REFLECTIONS OF K3
CRYPTOGRAPHY SEEN IN K4. SPECIFICALLY, THE 42 LETTER SUBSETS (R1/R2 R3/4 DISCONTINU-
ITY), THE BLOCK SIZE 84 (R5/R1 WRAP-AROUND), THE DOUBLE ROW FEATURE (WIDTH 21 // R1/R2
AND R3/R4), AND THE USE OF THE KRYPTOS KEYWORD IN FORMING THE CIPHER ALPHABET.

CONCLUSION:

THERE IS A CAUSAL CONNECTION BETWEEN K3 AND K4 CRYPTOGRAPHY.

*ONE OFFS ARE DEFINED AS ADJACENT LETTERS IN THE CIPHER ALPHABET DERIVED BY .KEYED
COLUMNAR TRANSPOSITION OF A STANDARD A-Z ALPHABET;

K R Y P T O S
1 4 7 3 6 2 5
a l w h s e p
b m x i t f q
c n y j u g r
d o z k v

this alphabet is equivalent to a width 11 write out of the standard a-z alphabet
the one offs with ug, and tf to name two are evidence of the keyed version.
