

Just to recap the procedure to recover 'berlincllock' via the morse code "dit-dah" system and resulting intermediate text:

1. Create the intermediate(real) cipher text via the morse code starting with TI, etc and the four extra alphabets on the right side of the Kryptos Tableau: So OBKR.. is set against TISY...from the morse and sequenced through. It appears that somewhere along the line letters are inserted in the K4 text, probably two at some point prior to NYPVTMZFPK, though it may also be that the morse sequence is shortened. At any rate, the correct matchup between the morse and the K4 berlincllock crib is shown in the following table

K4 Text	N	Y	P	V	T	T	M	Z	F	P	K
Morse=NONLINEAR SHIFT REGISTER	e	e	e	e	e	e	I	N	V	I	S
# dit-dahs = 1-4 alphabet	1	1	1	1	1	1	2	2	4	2	3
Intermediate Cipher text	B	L	M	E	N	N	T	A	N	I	W
Crib	b	e	r	l	i	n	c	l	o	c	k
Key on Kryptos Tableau	K	S	L	Q	T	K	U	J	H	S	W

becomes BLMENNTANIW. The correct line up of the morse key against berlincllock is eeeeeeeINVIS. This shows the 2010 clue to have been fairly friendly.

2. Identify the linkup between TI in EWWJ, EWJ etc on the K2 cipher(wesTIdbyrowS and xlayertwo) and TI at the end of row 7 (K2 row 5). wesTIDBYROWS . S=7 in Kryptos alphabet, see how Row S of Tableau side links to row end TI on the cipher side. This is the pointer for the key identification row.

3. Cribdrag (tuu and fro perhaps?) row 7 against BLMENNTANIW: first from the left normally which identifies the digraph crib segments as follows against the normal Kryptos tableau: TK=in, KS=be, JH=lo, KU=nc (duplicate n), then W as k and finally S as c so: "be--inclock". At this stage go backwards (turn the row or crib over)and drag again to pick up SLQ=erl. There is 'berlincllock'. Whether another key identification procedure exists or not, crib dragging will identify known or suspected plaintext without any problem. That being the easy part.

4. ? On a fun note, SLQ on the Kryptos Key becomes GRU on the Normal Alphabet Key. The rest might have to wait until after Thanksgiving. For me at any rate.

5. Someone emailed me a question about why I make weapon versions of Kryptos. Good question. Partly I suppose because I think it fits certain design elements of the puzzle, and possibly its hidden story line. But also because K3 ends "Can you see anything Q?". Well my contribution to the "Top Ten Kryptos K4 Solutions Competition" was a reply which starts "Not a damn thing Bond....". All of these answers of course used "one-time pad" keys that were simply the creation as a result of running the imagined 97 letter plaintexts against OBKR., not the actual intermediate cipher text described above. These keys

reportedly will be hidden in Geocaches at locations somehow related to Kryptos, as will a number of the jokes and back alley, dead end stuff, real or imagined that have become part of Kryptos lore.

Competition rules will be map and compass only, not this new fangled GPS stuff. At any rate, you know who Q is right? Not M, oops I mean W. So he goes missing in the above answer, but nevertheless there are a number of designs made by "Missing Q" involved here and they are not all weapons. I have put some other designs up there, I think. Possibly the "missing Q" will come back just like the "missing X" always does. Enjoy the rest of the puzzle.

Happy Thanksgiving.
