

The following derives from a statement made by Ed Scheidt regarding the use of a technique that would mask the K4 cipher text and would have to be overcome before tackling K4 directly. It is also suggested by a clue Ed has provided, that the persons most familiar with the mechanics of the technique would be rather young.¹ Now, what does one find posted on the wall in most high school science classrooms?

THE PERIODIC TABLE OF ELEMENTS

The Periodic Table provides the means to build a running cipher.

XORing this running cipher with the reverse of the K4 CT, aligned according to well documented clues, provides interesting results.

AN HISTORICAL CLARIFICATION

Before we toss ourselves into this pursuit, a significant fact needs to be addressed.

The periodic table **has changed** since the dedication of **Kryptos** on November 3rd, 1990.

In 1994, the names and symbols of a few of the elements were officially settled upon,

effectively changing what are currently the last few entries of the periodic table.

Here's the current standard periodic table (post 1994), as commonly portrayed.

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

¹ I'm sure I have documented this somewhere in my published works.

A quick glance at the Periodic Table reveals that the symbols for some atomic elements have one letter, some have two, and others have three.

Could these potential place holders play any significance?

For instance, one minor change we could make will subtly, but importantly, change the way we look at the table.

We could portray all symbols as having (at least) two characters. That is, we put a dash or placeholder in lieu of a second letter.

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
1	H-																	He

We can now more easily reveal the distinction between the **first** and **second** character of the element's symbols.

As we will see, this becomes important.

Here are the symbols, listed and rotated 90° (like somebody might do in a palimpsest) ...

EIEEAGLILRACIRNEOIUNAESERRBRBROCUHDGDNNEESAADRDMMUDBYORMBUFAESRTUGLBIOTNRACHAPUMMKFSMDORFBGHSTUUU

And **this** is our **running cipher**.

The first thing to note is that there aren't any J's or Q's (or V's, X's or Z's).

The second thing to note is that if we XOR our running cipher with the **reverse** of the original K4 CT, aligned according to the clues, we get...

(Angels heard on high)

² This is what initially triggered my realization about the importance of the period table.

Well, let's not get ahead of ourselves.

Why don't we begin by just XORing our running cipher with the **reverse** of the original K4 CT (including the ?).

```

      EIEEAGLILRACIRNEOIUNAESERRRRBOCUHDGDNNBEEAADRMMUDBYORMBUFAESRTUGLBIOTNRACHAPUMMKFSMDORFBGHSTUUU
      RACKEUAUHUHGIDCJTXZKDGWKPZMTTPYNBFNIWAIDULKJTAWZZKESQJSQWTWTOSSKGNRPQQVRLFWBBFILOSBLUHGOXOURKB0?
A13: WHFNDRMBDGDZVMOAQOEEDNBTXEFVYSLFFAJGYCLAFMJNFEZW00GJBCGQDRVQBAGDZBPYDEXZMEECRSDADUQAQGUIZHCAEWZU

```

Doesn't seem all that promising, does it?

However, here's where some well documented clues become helpful.

Recall the **RQ** from the Morse messages (found on the front entrance strata) and the intentional spelling error in **K1's IQLUSION**.

```

      RQ IQLUSION
      RQ IQLUSION
      RQ IQL

```

There are no Q's in the running cipher, but there are a number of R's and I's.

If we highlight all the **R's** and **I's** in the running cipher and all the **Q's** in the K4 CT, we get ...

```

      EIEEAGLILRACIRNEOIUNAESERRRRBOCUHDGDNNBEEAADRMMUDBYORMBUFAESRTUGLBIOTNRACHAPUMMKFSMDORFBGHSTUUU

A1 : WHFNDRMBDGDZVMOAQOEEDNBTXEFVYSLFFAJGYCLAFMJNFEZW00GJBCGQDRVQBAGDZBPYDEXZMEECRSDADUQAQGUIZHCAEWZU

```

But here, only one Q has a match with an R. Not good enough.

Maybe if we shift the running cipher one character (in this case, to the right).

```

      UEIEEAGLILRACIRNEOIUNAESERRRRBOCUHDGDNNBEEAADRMMUDBYORMBUFAESRTUGLBIOTNRACHAPUMMKFSMDORFBGHSTUUU
      RACKEUAUHUHGIDCJTXZKDGWKPZMTTPYNBFNIWAIDULKJTAWZZKESQJSQTWTWTOSSKGNRPQQVRLFWBBFILOSBLUHGOXOURKB0?
A1 : GDJNZTFYAYFJMQDQWSDJFRXUTHOFFTEZAJBIMYOKAPEJKPSSWWDAQJDXDSAQUJAERIDRXDBBDGTJCVBABXDEXLHCDMRZXVZU

```

Again, not all that promising.

However, (cutting to the chase) if we keep shifting⁴ (actually, rolling) one character at a time,

we will find that one,

and **only** one,

alignment⁵ provides a strong match to the Q's in the K4 ct and the RI's in the running cipher.

```

      BYORMBUFAESRTUGLBIOTNRACHAPUMMKFSMDORFBGHSTUUUEIEEAGLILRACIRNEOIUNAESERRRRBOCUHDGDNNBEEAADRMMUD

```

A little more promising.

³ I've used A1 to label the parameters of the XOR. The alphabet used is simply the English alphabet, where A is indexed by the value 1 (as opposed to zero indexing). B is 2, C is 3, etc. A0, on the other hand, would denote zero-indexed.

⁴ Recall the Sanborn clue to "try all possible shifts."

⁵ An exhaustive list of the various alignments can be found in the appendix.

Let's take a closer look at the results.

New Clues

ADD CUT

The letter sequences **ADD** and **CUT** naturally occur vertically when one renders the K4 CT as a table with seven columns.

ADD and **CUT** parallel nicely with the two keywords PALIMPSEST and ABCISSA.

The multidimensional confirmation of the clue is what one would expect from someone trying to pass on,
covertly, information to a future op⁸.

There are **11** other letters to be found in the column in which **CUT** occurs.

However, because of the **?**, there are only **10** other letters⁹ to be found in the column in which **ADD** occurs.

The XOR results of the 1st and 3rd roll include data that closely mimic these facts.

In roll 1, not only does the letter sequence **ADD** occur, but it occurs in a result that includes exactly **10** A's

In roll 3, not only does the letter sequence **CUT** occur, but it occurs in a result that includes exactly **11** C's.

Pay special attention to the letter sequences YOTBGK (KGBT0Y in reverse), RAY (YAR in reverse) and MKPOST.

MK is a prefix used extensively by the CIA in denoting various campaigns¹¹.

We'll have to wait to see if MKPOST will help guide us in the later journeys.

Before we go, however, I wish to share another observation.

In K4 (as rendered above), there are two additional letter sequences that I find intriguing.

The horizontal DIA beginning row nine, and the vertical CUR ending column seven.

Each includes one spelling error.

DDA	CUT	ADD	CUT
DIA	CUR	AID	CUR

To me, they present enticing opportunities to layer the results of roll 1 and 3 accordingly.

More Clues

WESTX¹²

WESTX, found in the 2nd roll, may have been a clue to reappraise the ending of **K2**, see the requirement for an extra letter, which would naturally result in an **X** following **WEST** (to acquire WESTX).

Here are the results of using a **Quagmire III** method on the **K2** CT, with primary keyword : **KRYPTOS**, secondary keyword : **ABSCISSA**.

PT NUTESFORTYFOURSECONDSWESTIDBYROWS (found by David Stein and Jim Gillogly)

```

If we were to insert a character at the designated spot in the K2 cipher text, just after the characters that provide the plaintext **WEST**, such that the resulting PT was an X (the required character turns out to be an **S**),

```

we would acquire the genuine K2, WESTXLAYERTWO.

DEAD END

I'm not sure yet what to make of this.

I suspect it may be there to warn us that the use of ADD and CUT has been fulfilled, so don't bother trying to use it to manipulate text.

Alas, there is so much more to talk about.

See the files **ADD CUT – A number of Approaches**.

Ways to manipulate cipher text - K2's coordinates.

Ways to manipulate cipher text - copperplate CT row length.

Ways to manipulate cipher text - cuts in petrified wood.

¹² If this was a genuine clue, why did Sanborn become flustered enough to permanently stain his work as having a genuine mistake? He could have just maintained that there was something more to K2 that we need to examine.
