

Hi Larry,

I promised my pieces going forward would show signs of ciphering to find the solution to part 4 of KRYPTOS.

Creative people at times can have many problems because we can see so much.

So I went back to the basics and wondered what Mr. James Sanborn birth year of 1945 might show me.

Maybe this was how Mr. James Sanborn found the letters from these four numbers of his birth year.

So the letter K from $9-4=5+5+1=11$ or the letter K, The letter R from $9+4+5=18$ or the letter R, The letter Y from $45-5 \times 4=20=25$ or Y, The letter P from $9 \times 4=36-4 \times 5=20=16$, The letter T from $5 \times 4=20$, The letter O from $19-9=10+5=15$, or the letter O, The letter S from #19 or the letter S. All the letters from the Alphabet A-Z.

So then I thought about the first word in the first solution BETWEEN and thought about the numbers BETWEEN the numbers 1 the lowest number and the number 9 the highest single number in the numbers from the year 1945.

So I wrote down the #'s BETWEEN 1-9, 2 3 4 5 6 7 8 and if you count 23 33 44 55 66 77 88 and then add a letter A BETWEEN each group of #'s 2A3 and a letter O BETWEEN each same # 33, 44,55,66,77,88 you should get something that looks like this 2A3030A404A505A606A707A808.

So 2=BACOCOADODAEOEAF0FAGOG.

Now the word COCOA made me think of the letter O's in the 3 solutions of KRYPTOS and then I remember the Ovaltine I use to drink as a child.

So I looked up OVALTINE on the computer and in the article on Wikipedia it mentioned KINGS LANGLEY and in this article towards the end it showed 4 different decoders with the last one in 1947 was named the KEY-O-MATIC.

Because of this group of 4 decoders and we are all looking for the 4th part of KRYPTOS, I thought about the word KRYPTOS and broke it down into (K) (RYPT) (OS).

Now the R,Y,P,T, letters from the word KRYPTOS added up to $R=18+Y=25+P=16+T=20$ for a total of 79. Since we are all looking for the 97 remaining Characters of part 4 of KRYPTOS I would use # 97 as my base number.

Then I went back to the 3 solutions of KRYPTOS and took another look at the letter O's and found 92 in the 3 solutions.

So since I had added up the 4 letters from the word KRYPTOS, The R,Y,P,T I decided to add up the 4 letters found with the 92 letter O's in the 3 solutions of KRYPTOS.

I added the letters O's and the 3 letters both forwards and backwards and started finding letter C to P and P to C.

Now it seemed to me that all 3 solutions would be involved with part 4 of KRYPTOS.

So I went back to the first word BETWEEN and added up the letters BETWE and they added up to 55, so you take your base $\#97-55=42$ and #55 on the A-Z alphabet from left to right is Letter C and #42 counting the same way is letter P.

Then I went to the words the OF LIGHT and the OFLI added up to 42, so $97-42=55$ another Letter C and letter P. Now this OFLI was in the first Solution.

Then I thought of the letters EN from the word BETWEEN and wondered about the letter E from the word TH(E) and the letters (NUAN) from the word NUANCE.

These letters also added up to #55, so $97-55=42$ another letter C and a letter P.

Then I went to solution #2 and found the words WAS TOTALLY that formed the 4 letters O,T,S,A going backwards, O,T,S,A also added up to #55, so $97-55=42$,

another letter C and P.

Then I remembered when I was writing down all of the letters in groups of 4 with the letter O's that going forwards down in solution 3 the 42 group of four letters came from the words TO FLICKER for another O,F,L,I like in solution #1 for another #42, so $97-42=55$, another letter C and P.

Then I went to the words CAN YOU SEE ANYTHING and the OYNA added up to another 55, so $97-55=42$, another Letter C and P.

Back in Solution #2, I had counted 27 letter O's and I new that it started off with the OTSA from WAS TOTALLY a #55, so $97-55=42$ and I wondered what would happen by changing the other 26 O's in solution #2 to the 26 letters in our Alphabet, A-Z.. I had found more letter C

The two groups that seemed to want to spell KRYPTOS were the VTDN that added up to number 60, so $97-60=37$ # 37 =K and # 60 going forwards through #52 on letter Z and ending on letter S. The first and last letter of KRYPTOS.

I also noticed that maybe the extra L that everyone seems to be looking for might come from MR. SANBORN first name HERBERT and the 5 letters from JAMES, for $7+5=12$.

Now I remember that JAMES adds up to 48 and SANBORN adds up to 83 and HERBERT adds up to 76. Maybe you subtract 14 from #48 to make 34 and add the 14 to #83 from SANBORN to make 97 and then subtract 21 from #34 and add the 21 to the # 76 from HERBERT to make another 97, leaves an 1 M -1 =12 or L.

I hope this helps solve part 4 of KRYPTOS.

I finally found a way with help from my friends at KRYPTOS to CIPHER in a creative way.
