

CLUESandSTUFF.pdf

1. OOH completes Hoover's name via 21 Caesar shift of TTM. DIAWI in Position 57 of K4 shift 0 (26).
2. 21 shift reveals DIAWI in position 61. Decision to run K4 CT through all 25 shifts. Modified variant, DWAI, revealed in position 31 of 16 shift.
3. Two other similar strings located. INFBN and NSKGS and their variants, IBFNN and NGKSS. These three strings occupy the same positions but are separated by 5 Caesar shifts per type and each type is separated from each succeeding version by -5 shifts.
4. Versions of all three types appear in the original zero shifted version of K4. They are DIAWI, INFBN and NGKSS.
5. Considering that the original version of a type lies at position 57, the secondary version at position 61 and the tertiary version at position 31, this sets up the following hierarchy:

Primary/Shift	Secondary/Shift	Tertiary/Shift
DIAWI/0 (26)	DIAWI/21	DWAI/16
INFBN/5	INFBN/0 (26)	IBFNN/21
NSKGS/10	NSKGS/5	NGKSS/0 (26)

6. So, in terms of type, the versions appearing in shift 0 (26) are:
DIAWI = Original, INFBN = Secondary and NGKSS = Tertiary.
7. Viewing the shift 0 (26) version of K4 we have:

Z O B K R
U O X O G H U L B S O L I F B B W F L R V Q Q P R NGKSS O
T W T Q S J Q S S E K Z Z W A T J K L U DIAWI INFBN Y P
V T T M Z F P K W G D K Z X T J C D I G K U H U A U E K C A R

8. So, the primary version can be considered in front, the secondary version is behind the primary version and the tertiary version is behind the secondary version.
9. Another way of looking at it is that Primary is in full light, Secondary is subtly shaded and it's fully dark behind the Tertiary.
10. From K1 PT: Between subtle shading and the absence of light lies the nuance of illusion. The nuance of illusion lies between what is subtly shaded and darkness. Therefore, the nuance of illusion lies between INFBN and darkness. NGKSS is the nuance of illusion, which points to its Primary (i.e., the non-nuanced version) NSKGS whose location is at shift 10.

J Y L U B
E Y H Y Q R E V L C Y V S P L L G P V B F A A Z B X Q U C C Y
D G D A C T A C C O U J J G K D T U V E NSKGS X P L X I Z
F D D W J P Z U G Q N U J H D T M N S Q U E R E K E O U M K B

11. Calling your attention to the K2 PT word UNDERGROUND: The corresponding CT is TBJLBQCETBJ. Notice the JLB matches the JLB highlighted in yellow in the K4 shift 10 version. Moreover, you can see the string JLBQCRT. The R repeats the "typo" creating the misspelling UNDERGRUUND. The adjacent E hints to that. The JLB corresponds to PT DER. That needs to be revisited later, but I think I know how it might apply.

12. Further, in the CNN interview, Sanborn used the word "tremendous" at least three times:

- ...NO TREMENDOUS MONETARY...
- ...HAD TREMENDOUS INTERESTS...
- ...TREMENDOUS RESPONSIBILITY...

I have highlighted the letters in those phrases that occur in ... HDTMNSQUERE... (bottom row of K4 shift 10) in the same order as they appear in that string.

13. Also appearing in the string is MNSQUERE, which sort of hints to MASQUERADE. But, I'm pretty sure it's pointing to MASK, instead. Remembering back to K1 we had in the PT 7-column pad, first column, AELSN which equals A else N, replace N with A. In the same column, but in the CT, we have QELSK = Q else K, replace Q with K. This turns MNSQ into MASK! So, K1 enters the picture again.
14. Speaking of K1, the CT has the characters JYLUB occupying almost 25 percent of the 63 positions.
15. Here is the K2 PT 12-column pad (derived by using the ABSCISSA shifted keyword of SAABSCIS of the last 120 characters of the K2 CT (X plus the coordinates). It contains a lot of clues and confirmations:

	W	O	W	F	M	O	P	F	H	H	W	R
	R	F	H	Y	D	F	I	C	S	G	O	P
	O	F	O	B	D	N	J	Q	Q	O	Q	P
	W	J	Z	T	T	J	Y	R	P	J	W	F
	O	F	M	Y	D	E	A	Q	T	Y	G	E
	W	F	W	F	M	O	E	P	Y	W	F	Q
	C	F	V	X	Y	F	A	F	H	H	W	R
	C	J	Q	V	P	F	I	C	V	Y	O	P
Misspelled	E	S	T	X	W	F	D	S	M	E	I	Q
KEY	Y	A	O	Z	J	B	E	B	M	O	X	S

It calls your attention by saying WOW twice. But it also says ROW O. YA = YES, Z in the place of S (remember HEATZIDBYROWS) as confirmed by ESTX right on top of YAOZ. Os also point to P for PYRAMID derived from the combination of the two spelling errors in K1. Remember that correcting both of the misspellings results in a W in the CT. If a W were to replace the P in this instance, the whole word WEST would precede the X. IQ reminds of IQLUSION. But it also has (also after O) the first six characters (in order, starting from the bottom, immediately above the O) of the second row of the 10 shift K4 CT plus the JY that starts it. See page 1, the characters highlighted in salmon color.

16. Note RQ/YR from the Morse slab. Remember the confusion as to whether the morse said RQ or YR, because this and "SOS" could be read straight ahead or upside down.
17. Also note RFHYD beginning row 2. This reminds of HYDRA shifted two positions to the right, but with F instead of A. But there is a JS above the A at the bottom of column 2 and Os surrounding the F in RFHYD as well as a column full of Fs. This points to replacing the F in RFHYD with an A, making it RAHYD. This fact supports my conclusion that DIAWI must undergo a similar transposition to WIDIA. This is hinted at in the K3 PT and also the CNN interview. I had already suspected strongly that that was hinted to by the relationship between HYDRA and DYAHR. I am wondering where to make the changes (transpositions inferred by this). In other words, do I change only those strings that have doublets, or do I change all seven-character strings similarly, or WHAT? I believe getting past the mask is dependent upon this process.
18. Before getting too far away from talking about MASK, which I believe is distinctly revealed by the above information, I want to mention something that I noticed. First, remember that characters JL appear in various places and are connected directly to K4 CT shift 10. They also appear in the Vigenere Tableau at the end of the first row of the bottom panel, the place talked about a lot and where there are disputes about whether the "extra L" was a mistake or not. It was not a mistake. And what's going on there explains why the extra four columns appear in the tableau. Here is why: The extra L is connected to the J. The JL is referring to K4 shift 10 that begins with JYLUB. In the bottom row of the shift 10 version of K4 lie the characters MNSQ. These convert to MASK, as I described above in paragraph 13. Again going to the JL in the tableau, those characters are directly connected, both vertically and horizontally to characters MNQ, three of the characters in MNSQ. The missing letter, S, was missing elsewhere in Kryptos (famously) and so it's easy to see JL and MASK in that corner of the tableau. I think this is one of the clues pointing to K4 shift 10 as being of primary importance.
19. Characters SJ appear between Qs (QSJQ) in K4 shift 0 (26). I believe they are significant both because they appear between Qs and they are pencilled darkly in Sanborn's notes. I've talked about them in Paragraph 17, above, but they appear in the string QSJQS which has QS twice separated by a J. This has a unique structure and so I spent a lot of time attempting to find a similar structure elsewhere. I did find a similar structure in MGENLEHREUHR, the name of the Berlin Clock. It exists as ENGEN. I suspect that using MGENLEHREUHR as a keyword against K4 with ENGEN lining up with QSJQS might be worth a try.
20. I did not mention many clues that I correctly understood or perceived that exist throughout the Kryptos PT and CT as well as in Sanborn's interview transcripts, many of which still need interpretation. Three examples: "...Job on the line." refers to JYLUB as first line of K4 shift 10. Both CANDLE and CAUSED refer to CAYLLDDZ(OUX) which tells where to place the Z at the front of K4 CT. PEERED means use PYRAMID as special keyword to check causal validity. Clues towards solving K4 exist throughout Kryptos.
