

Hello,

first post was not shown. So I give another try. I studied K4 for a while and found a pattern. It assumes that for a letter a alphabet is taken. Example for known BERLINCLOCK:

i) NYPVTMZFPK -> BERLINCLOCK order for V "WXY" Z V and Z lead to "L"

also M "N0" P lead to "C"

ii) Problem for N "0" P N-> B P ->R (further I call it BR-problem)

If you put a pattern like "00++00++00++00++00++00..." on the cipher. So that the first two letters "00" are translated with the first alphabet second two letters "++" with a second alphabet. The following "00"'s with the first alphabet and so on....

It gives us this cipher:

```
: A01 : A02 : B01 : B02 : A03 : A04 : B03 : -L : A05 : A05 : B05 : B06 : -K : A07 : B06 : B07 : A08 :
A01 : B08 : B01 : -R : A10 : B09 : B10 : A11 : A12 : B11 : B02 : -K : A10 : -B : B13 : -E : A14 :
B14 : B05 : -E : A15 : -I : B13 : -C : A17 : -B : B16 : -E : A12 : B13 : -I : A02 : -N : B17 : B05 :
A10 : A10 : B18 : B06 : A19 : -C : B11 : B16 : A07 : A20 : B03 : n-B : y-E : p-R : v-L : t-I : t-N : m-
C : z-L : f-0 : p-C : k-K : B06 : B08 : A07 : A14 : B20 : B07 : A12 : A21 : B21 : B21 : -R : A22 : -
B : B22 : A11 : A04 : B02 : -L : A03 : -C : -0 : B08 : A23
```

A01..A23 is the first alphabet. With A11=E; A09=R; A18=N; A16=C; A06=K

B01..B22 is the second alphabet. B12=B; B04=L; B15=I; B17=0

Assuming a), b) and c)

a) If we assume that every letter is only once used that would mean example B13 could not be "L" cause in the alphabet "BXX" B04 stands for "L".

b) at least two alphabets AXX and BXX cause of BR-problem!! -> see at ii)

c) Alphabets could not start with "KRYPTOS" cause their 0 and P are used in the partial order "MNOPQRSTUVWXYZ" ->see at i).

Someone could find a matching word in the area of

...B10 : A11 : A12 : B11 : B02 : -K : A10 : -B : B13 : -E : A14 : B14 : B0...

or near A11 : A04 : B02 : -L : A03 : -C : -0 : B08 : A23.

I used a database of normal english words and found some matches. But because of German is my mother language it is a endless task to me.

Regards,

RCZ
