

Write out the plaintext of K1 in rows of 5 letters, and note what appears in the same column as the Q:

BETWE
EN
SUB
TLESH
ADING
ANDTH
EABSE
NCEOF
LIGHT
LIEST
HENUA
NCEOF
IQLUS
ION

Most of the word CANDLE -- with the complete word LIGHT on the next row, to boot!! (As far as the fact that the E is missing, you can skip a row or go east from the L to get the E, or perhaps the missing E in DESPARATLY is a clue to this missing E). (06/14/14: Or, file this under "E, ABSCENCE OF" to quote lines 6 and 7 of this matrix. LOL)

This makes even more sense if you write in the K1 PT from bottom to top, as was suggested in "Solving Section III" on this page (<http://math.ucsd.edu/~crypto/Projects/KarlWang/index2.html>):

NOI
SULQI
FOECN
AUNEH
TSEIL
THGIL
FOECN
ESBAE
HTDNA
GNIDA
HSELT
BUSNE
EWTEB

Is the "breach" in the upper left hand corner, as mentioned in K3, relevant here or not?

Now for something REALLY interesting: Take the dYAhR sequence, rotate it counterclockwise and match it against the CANDL. Read from top to bottom, going left of CANDL for the superscript letters and to the right for the other letters.

R	E CN
H	B A E
A	D NA
Y	I DA
D	E L T

E E DIT.....A reference to the morse code with all the extra E's?

And if we consider the CANDL as the Y-axis in a 5x5 matrix (i.e. move the column on the left to the right, or just read in a wraparound fashion)...

O	E CNF
S	B A E E
T	D NA H
N	I DA G
S	E L T H

T DAH forms the X-axis.

Further speculation, 09/01/12 -- Similarly to how we moved the leftmost column to the right and got T DAH, look what happens if we move the topmost row to the bottom:

B	U SNE
E	W T E B
N	O I

The letter T ("T is your position") surrounded by the four points of the compass. (To get them into the correct orientation, you have to reflect along the x-axis.

The clues that are incorporated into these observations:

- 1) The Candle
 - 2) The typography of dYAhR, which then points to
 - 3) The Morse (E E DIT, T DAH)
 - 4) T is your position
 - 5) Compass rose
- and potentially
- 6) coordinates -- if not necessarily global lat/long coords, at least some type of Cartesian coordinates.

Are all these things there because of coincidence, or because of Sanborn's "carefully-chosen wording"?

New observation 09/04/12: Thinking more about the Morse, I asked myself how many dits and dahs there are in the complete alphabet -- turns out there are 82. Then I asked how many there would be on each line of the Vigenere tableau. I was particularly interested in whether any lines had exactly 97 dits and dahs. Turns out there are 2 (or 3, if you're looking at the Kryptos miniature rather than the original). One is the last line of the top half (starts with M, ends with I) and the other starts with R and ends with Q. Could the RQ in the Morse code be directing us to use this line of the tableau in conjunction with K4 in some way?

Interesting links (not necessarily directly related to this observation/theory):

<http://www.thekryptosproject.com/tjp/dinner/>

There's also a discussion of that conversation at the following link, with many interesting comments on the possible meaning of what Sanborn said:
