

# Kryptos K4

The first three Enigma-like messages

## Message 1 + 2

|             |             |             |          |                         |
|-------------|-------------|-------------|----------|-------------------------|
| LOBKRU00GHU | LBSOLIFBBWF | Cipher text |          |                         |
| YLKYLKYLKYL | YLKYLKYLKYL | Key layer 2 |          |                         |
| XXXXDUPHGFT | XXXPKIDLBUE |             |          |                         |
| KEY         | IPSIPSIP    | KEY         | ISTISTIS | Key layer 1             |
| IP          | SCAIHEAWR   | IS          | THQEUTSI | Plain text              |
|             |             |             |          | E Complementary letters |

KEY ist the day key and the plain text letters are used as message key. The second key layer may represent the additional shift to the key letters caused by the ring settings of the wheels (they were part of the day key and did not change)

## Message 3

|              |                       |             |            |
|--------------|-----------------------|-------------|------------|
| LRVQQPRNGKSS | Cipher text           |             |            |
| YLKYLKYLKYLK | Key layer 2           |             |            |
| IDVMPPZYGXIS |                       |             |            |
| ???          | QVYQVYQVY             | Key layer 1 |            |
| QVY          | XAROSE                | TNT         | Plain text |
| STX          | Complementary letters |             |            |

The complementary letters seems to play a role now. At this point the end of K2 might be important (because of X and ID). Still not shure how this works. The wheel settings of the day key are different but the ring settings are the same?
